

ENG.

hear cricket's ringing
 crickets flapping their
 wings, bee buzzing and
 the sounds of the lake's
 water lapping against the
 shore. The sky is also
 amazing. In the morning
 light glows from the
 sky. At noon, the sky glows
 purple, and at midnight
 the stars sparkle.

Q) Why does the poet want to
 go to Innisfree?

A The poet is in London and
 is standing on the street.
 The speaker decides to go to
 Innisfree, while being annoyed
 by the dark monotony of
 grey pavement, roads and
 the sound of traffic. Perhaps
 he is tired of the bustle of
 city life at this point.
 Therefore, he wants to go to
 Innisfree where he would
 build a cabin and leave a

clamour - some loud and combined noise
peaceful life surrounded by
nature.

Q) Why does the speaker in the poem desire to spend his time alone in his cabin?

A The speaker yearns for a peaceful setting where he can so exist with nature. In his imagination he hears the soft lapping of the water against its bank, the soft lowly glade instead of the clamour of city traffic and he sees a simple life in a cabin surrounded by a garden as opposed to the boring pavement of the city. Additionally, by growing his own food he will be self sufficient.

2) What sounds is the poet looking forward to hear in Innisfree?

A In W. B. Yeats poem, 'The Lake Isle of Innisfree' the poet longs to hear the tranquil sounds of nature, specially the lapping of lake water against the shore, the buzzing of honeybees and the cricket and linnet's song.

9) What does the expression 'Pavement grey' suggest? How does this contrast stand in Innisfree?

The phrase 'Pavement grey' in Yeats' 'The Lake Isle of Innisfree' suggest the dull, flat, concrete and lifeless environment of the city, symbolizing monotony and artificiality.

MATH

Diameter of the wheel = 63 cm
 $\Rightarrow$ radius of the wheel = $\frac{63}{2}$ cm
 $\Rightarrow$ circumference of the wheel $= 2\pi r$
 $= \left(2 \times \frac{22}{7} \times \frac{63}{2} \right)$ cm
 $= 198 \text{ cm} = 1.98 \text{ m}$

Dist. covered by the wheel in 1 revolution = 1.98 m.

Distance covered by the wheel in 1000 revolution = $\frac{198 \times 1000}{100}$ m
 $= 1980 \text{ m}$

17/12/24

Q) The diameter of the wheels of a car is 70 cm. How many revolutions will it make 99 km?

$d = 70 \text{ cm}$

$r = \left(\frac{70}{2} \right) \text{ cm} = 35 \text{ cm}$

circumference of wheel
 $= 2\pi r = (2 \times \frac{22}{7} \times 35) \text{ m}$

$= 220 \text{ m}$

$= \left(\frac{220}{100} \right) \text{ m} = \frac{11}{5} \text{ m}$

Now, $\frac{11}{5} \text{ m}$ is covered by the car in one revolution.

$\therefore (99 \times 1000) \text{ m} = 99000 \text{ m}$

Revolutions needed for 99000 m
 $= \left(1 \times \frac{5}{11} \times 99 \times 1000 \right) \text{ revolutions}$

$= 45000 \text{ revolutions}$

Q) A race track is in the form of a ring whose inner circumference is 264 m and the outer circumference is 308 m. Find the width of the track.

Let the inner and outer radii of the track be r m & R m respectively.
 Then, $2\pi r = 264$ & $2\pi R = 308$

$$\Rightarrow 2 \times \frac{22}{7} \times r = 264 \text{ and } 2 \times \frac{22}{7} \times R = 308$$

$$\Rightarrow r = \left(\frac{264 \times 7}{44} \right) = 42 \text{ & } R = \left(\frac{308 \times 7}{44} \right) = 49$$

$$\Rightarrow (R - r) = (49 - 42) \text{ m} = 7 \text{ m}$$

Hence the width of the track is 7 m.

- 1) The inner circumference of a circular track is 220 m and the width of the track is 7 m. Calculate the cost of putting up a fence along the outer circle of the track at the rate of ₹ 50/m.

Let the inner and outer radii of the track be x m & $(x+7)$ m resp.

Inner circumference = 220 m

$$2\pi x = 220$$

$$\Rightarrow 2 \times \frac{22}{7} \times x = 220$$

$$\Rightarrow x = \left(\frac{220 \times 7}{44} \right) = 35 \text{ m}$$

Outer radius of the track
= $(35+7)$ m = 42 m

Circumference of the outer
circle = $\left(2 \times \frac{22}{7} \times 42 \right)$ m = 264 m

$\therefore$ Rate of fencing = ₹ 50/m

$\therefore$ Total cost of fencing = ₹ (264×50)
= ₹ 13200

EX-20E

Find the circumference of a circle whose radius is

(ii) $r = 1.4 \text{ m}$

$$C = 2\pi r$$

$$= \left(2 \times \frac{22}{7} \times \frac{14}{10} \right) \text{ m} = \frac{44}{5} \text{ m}$$

$$= 8.8 \text{ m}$$

3) Find the circumference of a circle of radius 15 cm .
[Take $\pi = 3.14$]

$$r = 15 \text{ cm}$$

$$C = 2\pi r$$

$$= \left(2 \times \frac{314}{100} \times 15 \right) \text{ cm}$$

$$= \frac{9420}{10} = \boxed{942 \text{ cm}}$$

5) Find the diameter of a wire whose circumference is 63.8 m

$$C = 63.8 \text{ m}$$

$$\Rightarrow \cancel{2\pi r} \pi d = 63.8 \text{ m}$$

$$\Rightarrow d = \frac{\cancel{314}^{29} \cancel{638} \times 7}{10 \times \cancel{22}^{11}}$$
$$= \frac{203}{10} = 20.3$$

$$\therefore d = \boxed{20.3 \text{ m}}$$

7) The ratio of the radii of two circles is 5:3. Find the radius of their circumferences.

Let the radii of the given circles be $5u$ & $3u$ resp and let their circumferences be C_1 & C_2 resp.

$$\text{Then, } C_1 = 2 \times \pi \times 5u = 10\pi u \text{ \&}$$

$$C_2 = 2 \times \pi \times 3u = 6\pi u$$

$$\frac{C_1}{C_2} = \frac{\frac{5}{3} \pi R}{\frac{5}{3} \pi r} = \frac{5}{3} \Rightarrow C_1 : C_2 = [5:3]$$

a) A race track is in the form of a ring whose inner circumference is 528 m & the other circumference is 616 m. Find the width of the track.

Let the inner and outer radii be r m & R m resp.

Then, $2\pi r = 528$ m & $2\pi R = 616$ m

$$\Rightarrow 2 \times \frac{22}{7} \times r = 528 \quad \& \quad 2 \times \frac{22}{7} \times R = 616$$

$$\Rightarrow r = \left(\frac{528 \times 7}{44} \right)$$

Metals and Non-Metals

Exception of cases: Pb, Na, K, Li
(malleability & ductility)

Exceptional case of conductivity:

Graphite is a non metal but is a good conductor of electricity but not conductor of heat

Diamond is a good thermal conductor but not a good electrical conductor.

Metals are usually solid in nature but mercury is liquid

Diamond is non metal but its the hardest material.
